

Alka Reef +

maintains optimum levels of alkalinity in reef aquariums by supplying carbonate ions.

PACKAGING

- **Standard Range,**
Aquarium from 120 to 1 000 l
(30 to 250 US gal)

Box of 10 vials

Water pH is an essential parameter to monitor because major variations of its level are harmful to reef aquarium inhabitants. In this environment, carbonate and hydrogen carbonate ions are responsible for the biggest part of the global alkalinity. Their buffer capacity also helps to reduce the unwanted pH variations.

Carbonate and hydrogen carbonate ions are also used by calcifying organisms, such as corals and coralline algae, in order to form the calcium carbonate of their rigid structures. It is therefore vital that these ions are regularly added to reef aquariums.

Alka Reef+ contains carbonate ions to maintain your aquarium at its optimum alkalinity level. It works with Calci Reef+, a calcium hydro-gel that slowly releases hydrogen carbonate ions into the water.

An Alka Reef+ ampoule contains 1,050mg of carbonate (which equals 35 meq/L, 1750 ppm of CaCO₃ or 98 d°KH). In addition to carbonate ions, the calcification reaction also uses up calcium.

We therefore recommend that you add one ampoule of Calci Reef+ for every two ampoules of Alka Reef+ you use. The combination of these two products generates an ionic balance close to that of natural sea water, but we still recommend that you regularly change the water in your aquarium.

Alka Reef+ is gluconate free.

DOSAGE FOR EACH PRODUCT

- **Standard range :**
2 vials for 120 l (30 US gal) / week
